

The background features abstract, overlapping green geometric shapes, primarily triangles and polygons, in various shades of green, creating a modern and dynamic visual effect.

CS 35L

Software Construction Laboratory

Lecture 3.1

15th October, 2019

Logistics

- ▶ Assignment 3
 - ▶ Due on October 21st
- ▶ Hardware requirement for Week 8
 - ▶ Seeed Studio BeagleBone Green Wireless Development Board
- ▶ Assignment 10 Signup Sheet
 - ▶ Teams of 2
 - ▶ <https://docs.google.com/spreadsheets/d/1PVqVMEEsHjmmj9YLyqz5K4wU-k0Dwwm2iO9uS1Zq1wk/edit?usp=sharing>
 - ▶ Names must be filled by Friday of Week 3
 - ▶ Topic can be selected later
 - ▶ Ensure that topics are not the same

Review - Previous Lab

- ▶ Regular Expressions
 - ▶ BRE vs ERE
 - ▶ Examples
- ▶ Sed & grep

The background features abstract, overlapping green geometric shapes, primarily triangles and polygons, in various shades of green, creating a modern and dynamic visual effect.

Week 3

Modifying and Rewriting Software

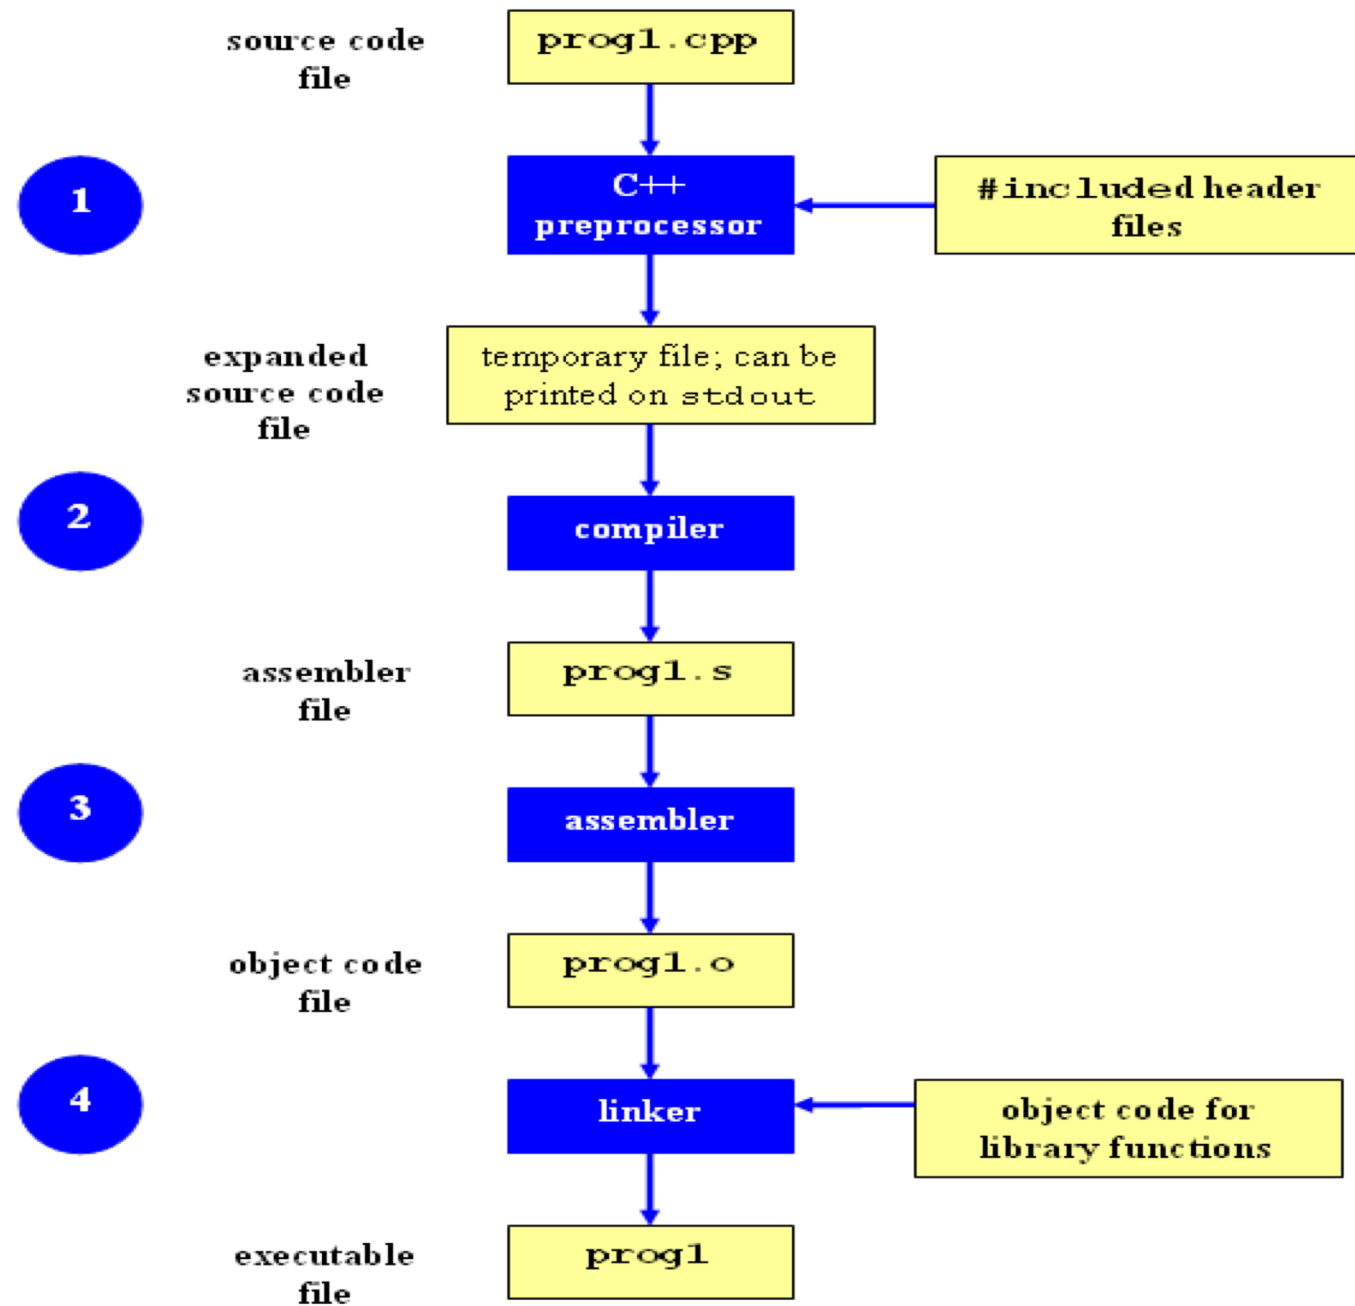

How to Install software

- ▶ Windows
 - ▶ Installshield
 - ▶ Microsoft/Windows Installer
- ▶ OS X
 - ▶ Drag and drop from .dmg mount -> Applications folder
- ▶ Linux
 - ▶ Rpm (Red hat Package Management)
 - ▶ RedHat Linux (.rpm)
 - ▶ apt-get (Advanced Package Tool)
 - ▶ Debian Linux, Ubuntu Linux (.deb)
 - ▶ **Good old build process**
 - ▶ **configure, make, make install**

Decompressing Files

- ▶ Generally, you receive Linux software in the tarball format (.tgz) or (.gz)
- ▶ Decompress file in current directory:
 - ▶ `$ tar -xzf filename.tar.gz`
 - ▶ Option -x: --extract
 - ▶ Option -z: --gzip
 - ▶ Option -v: --verbose
 - ▶ Option -f: --file

Compilation Process

Command Line Compilation

- ▶ `shop.cpp`
 - ▶ `#include shoppingList.h` and `item.h`
- ▶ `shoppingList.cpp`
 - ▶ `#include shoppingList.h`
- ▶ `item.cpp`
 - ▶ `#include item.h`
- ▶ How to compile?
 - ▶ `g++ -Wall shoppingList.cpp item.cpp shop.cpp -o shop`

What if..

- ▶ We change one of the header or source files?
 - ▶ Rerun command to generate new executable
- ▶ We only made a small change to item.cpp?
 - ▶ not efficient to recompile shoppinglist.cpp and shop.cpp
 - ▶ Solution: avoid waste by producing a separate object code file for each source file
 - ▶ `g++ -Wall -c item.cpp...` (for each source file)
 - ▶ `g++ item.o shoppingList.o shop.o -o shop` (combine)
 - ▶ Less work for compiler, saves time but more commands

What if..

- ▶ We change item.h?
 - ▶ Need to recompile every source file that includes it & every source file that includes a header that includes it. Here: item.cpp and shop.cpp
 - ▶ Difficult to keep track of files when project is large
 - ▶ Windows 7 ~40 million lines of code
 - ▶ Google ~2 billion lines of code
- ▶ => **Make**

Make

- ▶ Utility for managing large software projects
- ▶ Compiles files and keeps them up-to-date
- ▶ Efficient Compilation (only files that need to be recompiled)

Makefile example

Makefile - A Basic Example

all : shop #usually first

shop : item.o shoppingList.o shop.o

g++ -g -Wall -o shop item.o shoppingList.o shop.o

item.o : item.cpp item.h

g++ -g -Wall -c item.cpp

shoppingList.o : shoppingList.cpp shoppingList.h

g++ -g -Wall -c shoppingList.cpp

shop.o : shop.cpp item.h shoppingList.h

g++ -g -Wall -c shop.cpp

clean :

rm -f item.o shoppingList.o shop.o

Rule

Build Process

- ▶ configure
 - ▶ Script that checks details about the machine before installation
 - ▶ Dependency between packages
 - ▶ Creates 'Makefile'
- ▶ make
 - ▶ Requires 'Makefile' to run
 - ▶ Compiles all the program code and creates executables in current temporary directory
- ▶ make install
 - ▶ executables are copied into the final directories (system directories)

Lab 3 - Assignment

- ▶ Coreutils 8.29 has a problem
 - ▶ `$ la -A` is equivalent to `ls -a -A`
 - ▶ if the current directory has two files named `.foo` and `bar`, the command `la -A` outputs four lines, one each for `..`, `...`, `.foo`, and `bar`.
 - ▶ These users want `la -A` to output just two lines instead, one for `.foo` and one for `bar`
- ▶ Why?
 - ▶ the `-a` option always overrides the `-A` option regardless of which option is given first
- ▶ Want the flag that comes later to take effect
- ▶ Fix the `ls` program

Step 1 - Getting Started

- ▶ Download coreutils-8.29 to your home directory
 - ▶ Use 'wget'
- ▶ Untar and Unzip it
 - ▶ `tar -xJvf coreutils-8.29.tar.xz`
- ▶ Make a directory `~/coreutilsInstall` in your home directory (this is where you'll be installing coreutils)
 - ▶ `mkdir ~/coreutilsInstall`

Step 2 - Building coreutils

- ▶ Go into coreutils-8.29 directory. This is what you just unzipped.
- ▶ Read the INSTALL file on how to configure “make”, especially --prefix flag
- ▶ Run the configure script using the prefix flag so that when everything is done, coreutils will be installed in the directory ~/coreutilsInstall
- ▶ Compile it: make
- ▶ Install it: make install (won't work on Linux server without proper prefix!)
 - ▶ Find out why

Step 3 - Reproduce Bug

- ▶ Reproduce the bug by running the version of 'ls -a -A ' in coreutils 8.29
- ▶ If you just type \$ ls at CLI it won't run 'ls' in coreutils 8.29
 - ▶ Why? Shell looks for /bin/ls
 - ▶ To use coreutils 8.29: \$./ls
 - ▶ This manually runs the executable in this directory

Step 4 - Patching

- ▶ A patch is a piece of software designed to fix problems with or update a computer program
- ▶ It's a diff file that includes the changes made to a file
- ▶ A person who has the original (buggy) file can use the patch command with the diff file to add the changes to their original file
- ▶ `patch -pnum < patch_file`
 - ▶ 'man patch' to find out what pnum does and how to use it

Step 4 - Applying a Patch

Source Files

Original File

Modified File

Patch File

Original File

Patch File

Modified File

Diff Unified format

- ▶ `diff -u original_file modified_file`
- ▶ `--- path/to/original_file`
- ▶ `+++ path/to/modified_file`
- ▶ `@@ -l,s +l,s @@`
 - ▶ `@@`: beginning of a hunk
 - ▶ `l`: beginning line number
 - ▶ `s`: number of lines the change hunk applies to for each file
 - ▶ A line with a:
 - ▶ `-` sign was deleted from the original
 - ▶ `+` sign was added to the original
 - ▶ stayed the same

Step 4 & 5 - Patching and Building

- ▶ `cd coreutils-8.29`
- ▶ `vim` or `emacs` `patch_file`: copy and paste the patch content
- ▶ `patch -pnum < patch_file`
 - ▶ ‘`man patch`’ to find out what `pnum` does and how to use it
- ▶ `cd` into the `coreutils-8.29` directory and type `make` to rebuild patched `ls.c`.
 - ▶ **Don't install!!**

Step 6 - Testing Fix

- ▶ Test the following:
 - ▶ Modified ls works
 - ▶ Installed unmodified ls does NOT work
- ▶ Test on:
 - ▶ Empty directory
 - ▶ Directory containing a hidden file
 - ▶ With just -a, with just -A
 - ▶ With -aA
 - ▶ With -Aa
- ▶ Answer Q1 and Q2 in the Assignment

Questions?
