CS 35L Software Construction Laboratory

Lecture 4.1

22nd October, 2019

Logistics

- Assignment 4
 - ▶ Due on October 28th
- Hardware requirement for Week 8
 - Seeed Studio BeagleBone Green Wireless Development Board
- Assignment 10 Signup Sheet
 - ► Teams of 2
 - https://docs.google.com/spreadsheets/d/1PVqVMEEsHjmmj9YLyqz5K4wU-k0Dwwm2iO9uS1Zq1wk/edit?usp=sharing
 - ▶ Names must be filled by Friday of Week 3
 - ► Topic can be selected later
 - ▶ Ensure that topics are not the same
- Office Hours this week:
 - Friday 9:30 11:30 am BH3256S

Review - Previous Lab

- Python
- ► Build Process
 - **►** Configure
 - ► Make
 - ► Make Install

C Programming

Basic Data Types

- int
 - ► Holds integer numbers
 - Usually 4 bytes
- float
 - ► Holds floating point numbers
 - Usually 4 bytes
- double
 - ► Holds higher-precision floating point numbers
 - Usually 8 bytes (double the size of a float)
- char
 - ► Holds a byte of data, characters
- void

Format Specifiers in C

- Defines the type of data to be printed on standard output -
- printf("%d", 4); //%d is integer

Data Types Revised

Data Type	Range	Bytes	Format Specifiers
char	-128 to 127	1	%c
unsigned char	0 to 255	1	%с
short signed int	-32,768 to 32,767	2	%d
short unsigned int	0 to 65,535	2	%u
signed int	-32768 to 32767	4	%d
unsigned int	0 to 65535	4	%u
long signed int	-2147483648 to 2147483647	4	%ld
long unsigned int	0 to 4294967295	4	%lu
float	-3.4e38 to 3.4e38	4	%f
double	-1.7e308 to 1.7e308	8	%lf
long double	-1.7e4932 to 1.7e4932	8	%Lf
Note: The sizes in this figure are for 32 bit compiler			

A simple C Program

```
#include <stdio.h>
int main() {
    printf("Hello World\n");
    return 0;
}
```

Loops

- ▶ int i; //initialize outside the loop unlike C++
- for(i=0;i<10;i++){</pre>
- **>** }
- ▶ int i=0; //initialize outside the loop unlike C++
- while(i<10){</p>
- i++; }

Functions

- Function Name
- Return Type
- Arguments/Parameters
- Function Body

```
int func(int a){
    //function body
return 0;
}
```

Parameter Passing

- Pass by value
 - ► The data associated with the actual parameter is copied into a separate storage location assigned to the formal parameter.
 - Any modifications to the formal parameter variable inside the called function or method affect only this separate storage location and will therefore not be reflected in the actual parameter in the calling environment

```
int add(int a, int b) {
return a+b;}
void main() {
int x=4,y=8;
int z = add(x,y);
printf("%d",x);}
```

Structs

- No classes in C
- Used to package related data (variables of different types) together
- Single name is convenient

```
struct Student {
    char name[64];
    char UID[10];
    int age;
    int year;
};
struct Student {
    char name[64];
    char UID[10];
    int age;
    int year;
} student;
```

C structs vs. C++ classes

- C structs cannot have member functions
- C++ classes can have member functions
- There's no such thing as access specifiers in C
- C++ class members have access specifiers and are private by default
- C structs don't have constructors defined for them
- C++ classes must have at least a default constructor

Reading/Writing Characters

- int getchar();
 - Returns the next character from stdin
- int putchar(int character);
 - Writes a character to the current position in stdout

Pointers

- Variables that store memory addresses
- Declaration
 - < <variable_type> *<name>;
 - ▶ int *ptr; //declare ptr as a pointer to int
 - ▶ int var = 77; // define an int variable
 - ptr = &var; // let ptr point to the variable var

Points to Remember

- Normal variable stores the value whereas pointer variable stores the address of the variable
- ▶ The content of the C pointer always be a whole number i.e. address
- C pointer is always initialized to null, i.e. int *p = null
- The value of null pointer is 0
- ▶ & symbol is used to get the address of the variable
- * symbol is used to get the value of the variable that the pointer is pointing to
- ▶ If a pointer in C is assigned to NULL, it means it is pointing to nothing
- Two pointers can be subtracted to know how many elements are available between these two pointers
- But pointer addition, multiplication, division are not allowed
- ▶ The size of any pointer is 4 byte (for 32 bit compiler).

Dereferencing Pointers

- Accessing the value that the pointer points to
- Example:

```
double x, *ptr;
ptr = &x; // let ptr point to x
*ptr = 7.8; // assign the value 7.8 to x
```

Pointer Example

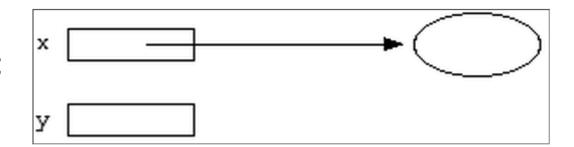

int *x;

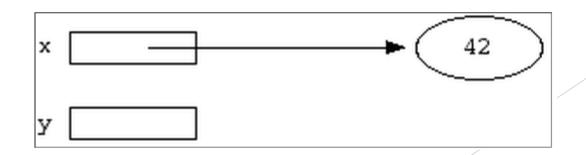

int *y;

int var; x = &var;

*x = 42;

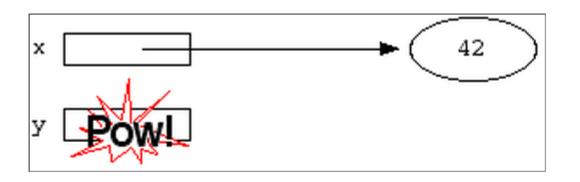

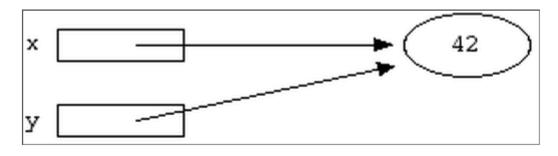

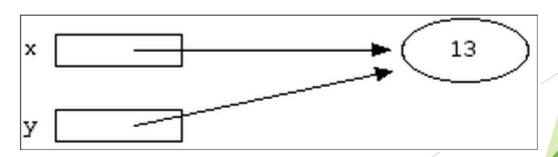

Pointer Example

$$y = x$$
;

$$*x = 13;$$
 or

Double Pointer

char c = 'A' char *cPtr = &c char **cPtrPtr = &cPtr

cPtrPtr

&cPtr

cPtr

&c

С

'Α'

Parameter Passing

- Pass by reference
 - ► The formal parameter receives a pointer to the actual data in the calling environment. Any changes to the formal parameter are reflected in the actual parameter in the calling environment.

```
void swap(int *a, int *b) {
 int tmp = *a;
 *a = *b;
 *b = tmp;}
void main() {
  int a = 1;
  int b = 2;
  printf("before swap a = %d\n", a);
  printf("before swap b = %d\n", b);
  swap(&a, &b);
  printf("after swap a = %d\n", a);
  printf("after swap b = %d\n", b); }
```

Task 1

Create a function s.t. it takes three numbers 'a', 'b' and 'c' as arguments, computes ab and store the results in 'c'. It should not return any value. Call this function from main() and print the answer in main().

- ► Hint: pass by reference
- ► Hint: you may want to see the pow function [check the return type and library]

Task 1 Solution

```
#include <stdio.h>
#include <math.h> //library import
void exponent(int a, int b, double *c){
    *c=pow(a,b); //pow returns a pointer
int main() {
        int a=2;
        int b=2;
        double result;
        exponent(a,b,&result);
        printf("%f", result);
        return 0;
```

Dynamic Memory

- Memory that is allocated at runtime
- Allocated on the heap
- void *malloc (size_t size);
 - ► Allocates size bytes and returns a pointer to the allocated memory
- void *realloc (void *ptr, size_t size);
 - ► Changes the size of the memory block pointed to by ptr to size bytes
- void free (void *ptr);
 - ► Frees the block of memory pointed to by ptr

Assignment 10 - Presentations

- ► Today's Presentation
 - Arnav Mathur
 - ▶ Varun Sivashankar
- Next Class
 - ► Alvin Nguyen
 - ► Henry Kou

Questions?
